

Citius Minds aids an automotive technology company in building robust infringement contentions and securing a favorable settlement

Challenge:

An automotive technology company developed a radar-based collision avoidance system and suspected that a competitor had launched a similar system infringing upon their patented technology. The client needed infringement contentions to initiate legal proceedings.

Execution:

Our team analyzed the client's patents to extract key claim elements and features of their invention. We then compared these claims against the competitor's publicly available documentation, product manuals, and technical disclosures.

A strong infringement contention was built by identifying the exact overlaps between the competitor's system and the client's patented features, including radar frequency usage, signal processing algorithms, and feedback mechanisms. We drafted:

- Claim charts with precise mappings.
 - Supporting evidence from the competitor's promotional materials and product teardown analyses.
 - A summary of technical similarities presented in a clear, compelling format
-

Impact:

The infringement contentions were instrumental in initiating legal proceedings. The competitor agreed to negotiate licensing terms, resulting in a favorable settlement for the client.

“The team at Citius Minds delivered meticulously crafted infringement contentions that left no room for doubt. Their detailed claim charts and supporting evidence were pivotal in securing a favorable settlement, turning a legal challenge into a strategic win. Their professionalism and precision are unmatched.”
